Autumn 2009

News from Sweden

Nederman has received two orders worth over \$5 million from the energy sector. One is from the windpower industry and the other from the solar power manufacturing industry.

“It’s very satisfying that we can develop and sell systems to a sector that despite the general business recession continues to perform positively” says Sven Kristensson , CEO, Nederman Group.

“We have seen that more and more countries are investing in building up industries for alternative energy producing products. Over the past few months we’ve received similar orders from Norway and Singapore for silicon wafers for the solar industry” he concludes.

The order for the wind power industry included a number of complete high vacuum systems for capturing and filtering particles that form when machining composite material. The rotary blades of the wind turbines are made from composite material. Composite is used more and more in this type of manufacturing, such as cars, boats, aeroplanes and tanks.

The other order for the solar power manufacturing industry includes over 20 separate installations of high and low vacuum extraction systems needed for a new eco-friendly plant.

New look Atsource website...

We're excited about our more informative new website - check it out at www.atsource.co.nz

The EXPO

AtSource exhibited at The Transport and Heavy Equipment Expo @ Mystery Creek early in March.

On display were vehicle exhaust fume extraction systems and welding for these industries. There are many carcinogenic elements in diesel exhaust fumes. Many personnel within the transport and heavy engineering industries are exposed to exhaust fumes on a daily basis. Our stand was designed to raise awareness and to demonstrate solutions to these problems.
